## Technical Information

### VPN, host-to-host VPN

The VPN, which is a virtual private network, provides the connection between two hosts via a crypto VPN tunnel. A virtual network is created between the two hosts and the entire data stream is carried over this network. Thus, applications running on this VPN benefit from the functionality, security, and management of VPN. VPNs usually provide authenticated connections using tunneling protocols and encryption techniques. VPN is a known application among today's computer users because it is an entrance ban applied to some internet sites. Users can bypass these prohibitions using VPN. The VPN service handles by the ISP(Internet Service Provider) it receives. In other words, the VPN serves according to the region where the internet service provider is located. If the ISP in which the VPN used is in service is in the US, the user is also served like the US.

Figure 12-4. Host-to-Host VPN

Figure Reference : [http://academlib.com/26730/computer\\_science/remote\\_access\\_host-to-site](http://academlib.com/26730/computer_science/remote_access_host-to-site)

### IPSec

The Internet Protocol Security (IPSec) protocol secures network communications by verifying and encrypting incoming and outgoing ip packets. IPSec can provide security between host-to-host, newtwork-to-host, and network-to-network connections. IPSec basically provides the following security situations: Data Confidentiality, Data Integrity, Message Origin Authentication.

IPSec provides security for data security using various encryption algorithms. Thus, even if the malicious users access the data directly, they will still be encrypted. IPSec uses encryption algorithms such as DES, DES3, and AES for data security.

IPSec also provides data integrity. Data integrity is a guarantee that the sender does not change the addition or subtraction until it reaches the receiver. IPSec uses hash algorithms such as MD5 and SHA-1 for data integrity.

Another function that IPSec provides is message origin authentication. That is, they can guarantee that the donation comes from whom and the sender is the sender. This function ensures that the data security is done with the correct source.

IPSec actually consists of several IP protocols. These are IKE(Internet Key Exchange), ESP(Encapsulating Security Payload) and AH(Authentication Header). IPSec uses these protocols to create a secure tunnel between two hosts.

Internet Key Exchange(IKE) : He is responsible for the pyrogenation of the keys. The sender and receiver exchange keys. Because IPSec uses symmetric encryption algorithm for data encryption, the sharing of keys must be secure, so IKE is used. IKE protocols enable key sharing in a secure way.

Authentication Header(AH) : AH provides data integrity and data source authentication. The AH is buried in the desired data to be protected. Since the ESP protocol, the AH protocol has lost its significance.

Encapsulating Security Payload(ESP) : IPSec provides data confidentiality with this ESP. ESP provides confidentiality of the data, that is, secure data flow traffic. The pinging process will be secure communication so that the ICMP will not be with ESP but with the ESP. ESP can also see the AH in action, ie authentication. The ESP denuded the AH recommendation.

## **Libreswan**

Libreswan is a free software for the supported and standardized VPN protocol using IPSec and IKE protocols. NSS uses the library. We used this application for this experiment.

## **NAT-TRAVERSAL**

The address information of the sender needs to be changed in each IP packet that moves between interconnected hosts. This process of changing IP is called NAT (network address translation). With NAT, millions of computers connected to the Internet need not be given different IP addresses. You can not ping any items outside the virtual NAT network because of the way VirtualBox applies NAT. For this reason, we used bridge adapter for this noney not NAT. Bridged network is for more sophisticated networking requirements such as network simulations and servers running at a guest. When enabled, VirtualBox connects to one of your installed network cards and directly switches network packets by bypassing your host operating system's network stack.

## **Wireshark**

WireShark is a program that allows you to analyze all internet network traffic. The selected internet interface analyzes incoming and outgoing packets by listening. It provides the source and destination address, the protocol used, the protocol in, and the data content such as the contents of the data. More than 750 protocols can be analyzed. It is a widely and widely used packet analysis program suitable for many operating systems. In this experiment, we used wireshark to observe which protocol was used for pinging.

## Experiment Phases

In this experiment, we created a host-to-host VPN tunnel application using the IPSec protocol. In this way, we have encrypted secure network connection between two hosts. The ipsec protocol was used for this secure network traffic. The IPSec protocol uses two IP protocols: AH and ESP. AH for authentication, ESP is done in two tasks: Identity Principle Verification and Data Encryption. We used the **libreswan** program, which uses the ipsec protocol for this experiment. We use RSA key encryption algorithm for the securely VPN tunnel. There is another method its name is PSK(Pre Shared Key). PSK is easier but not safe therefore we used RSA Key method in this experiment. There are two side, the left host and the right host, who have performed the following operations on these hosts. Finally, we ping it and observe that this ping is done with esp protocol instead of ICMP.

Note : We used both ip address and hostname because the hostname is more understandable than ip address. The steps in left host and right host are done in order.

### *Left Host*

*ip address : 192.168.2.216*  
*hostname : left.hasan.fedora*  
*operating system : fedora 24*

**Step 1 :** We installed fedora 24 on virtualbox and learned internet ip address via **ifconfig** command as seen as figure 2. After that, ping to right host because we try the connection before beginning and we observed not successful this ping. Result of our research this error is relevant NAT. We explain this condition in the technical information part and solution is using Bridged Mode instead of NAT for the VM in the host VirtualBox GUI as seen as figure 1.

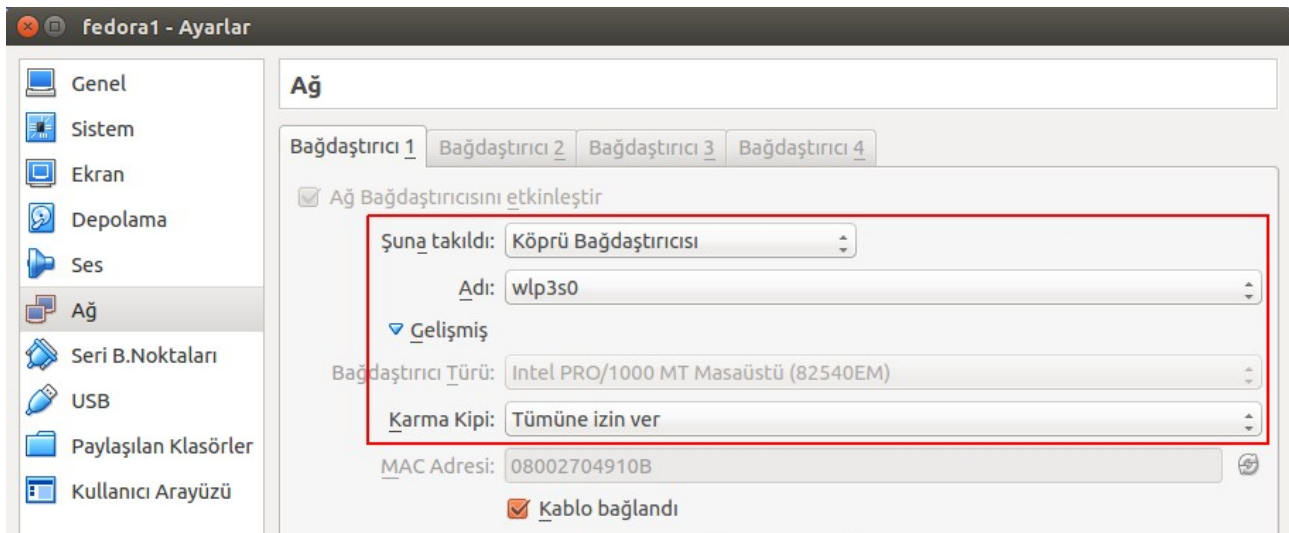

Figure 1

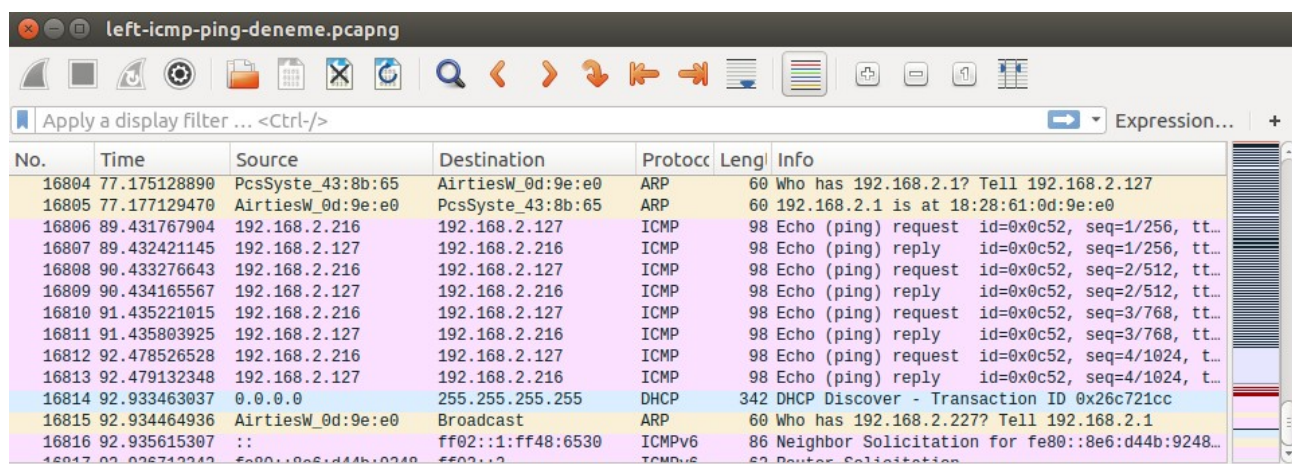

```
hasan@hasan:~  
Dosya Düzenle Görünüm Ara Uçbirim Yardım  
[hasan@hasan ~]$ ifconfig  
enp0s3: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> mtu 1500

**Step 3 : sudo dnf insall libreswan**

# Installed libreswan program as seen as figure 5.

```
[hasan@hasan ~]$ sudo dnf install wireshark
[sudo] password for hasan:
Last metadata expiration check: 0:17:04 ago on Sat Dec 31 15:18:10 2016
```

Figure 5

#### Step 4 : **ipsec newhostkey --output /etc/ipsec.secrets**

# This command generated RSA key for host to using securely network traffic as seen as figure 6.

# "--output /etc/ipsec.secrets" is used to determined name and path.

# When we executed first time this command, we got an error for about initializing NSS database.

**sudo ipsec initnss --configdir /etc/ipsec.d**

# We must run this command once time so initializing nss database. NSS is a userspace library utilized by the libreswan IKE daemon 'pluto' for cryptographic operations.

# After that, we executed "**ipsec newhostkey --output /etc/ipsec.secrets**" command and generated RSA key pair with CKAID as seen as figure 6.

```
[hasan@hasan ~]$ sudo ipsec newhostkey --output /etc/ipsec.secrets
[sudo] password for hasan:
/usr/libexec/ipsec/newhostkey: WARNING: file "/etc/ipsec.secrets" exists, append
ing to it
NSS database in /etc/ipsec.d not initialized.
Please run 'ipsec initnss --configdir /etc/ipsec.d'
[hasan@hasan ~]$ sudo ipsec initnss --configdir /etc/ipsec.d
Initializing NSS database

[hasan@hasan ~]$ sudo ipsec newhostkey --output /etc/ipsec.secrets
/usr/libexec/ipsec/newhostkey: WARNING: file "/etc/ipsec.secrets" exists, append
ing to it

Figure 8

**Step 8 : ping 192.168.2.127** # ping to right host using ip address as seen as figure 9.  
**ping right.taha.fedora** # ping to right host using hostname as seen as figure 10.

# We tested securely network traffic by ping to right host from left host and we observed that provide connection with ESP as seen as figure 11.

The screenshot shows a Fedora VM window with a terminal and a network traffic capture tool. The terminal displays the results of ping commands to 192.168.2.127. The first ping shows 9 packets transmitted, 9 received, 0% packet loss, and a time of 8130ms. The second ping shows 21 packets transmitted, 0 received, 100% packet loss, and a time of 20467ms. The third ping shows 7 packets transmitted, 7 received, 0% packet loss, and a time of 6011ms.

The network traffic capture tool shows a list of captured packets. The first packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The second packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The third packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The fourth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The fifth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The sixth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The seventh packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The eighth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The ninth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The tenth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The eleventh packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The twelfth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The thirteenth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The fourteenth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The fifteenth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The sixteenth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The seventeenth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The eighteenth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The nineteenth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The twentieth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The twenty-first packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The twenty-second packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The twenty-third packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The twenty-fourth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The twenty-fifth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The twenty-sixth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The twenty-seventh packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The twenty-eighth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The twenty-ninth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The thirtieth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The thirty-first packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The thirty-second packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The thirty-third packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The thirty-fourth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The thirty-fifth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The thirty-sixth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The thirty-seventh packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The thirty-eighth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The thirty-ninth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The fortieth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The forty-first packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The forty-second packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The forty-third packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The forty-fourth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The forty-fifth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The forty-sixth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The forty-seventh packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The forty-eighth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The forty-ninth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The fiftieth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The fifty-first packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The fifty-second packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The fifty-third packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The fifty-fourth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The fifty-fifth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The fifty-sixth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The fifty-seventh packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The fifty-eighth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The fifty-ninth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The sixtieth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The sixty-first packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The sixty-second packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The sixty-third packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The sixty-fourth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The sixty-fifth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The sixty-sixth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The sixty-seventh packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The sixty-eighth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The sixty-ninth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The seventieth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The seventy-first packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The seventy-second packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The seventy-third packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The seventy-fourth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The seventy-fifth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The seventy-sixth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The seventy-seventh packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The seventy-eighth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The seventy-ninth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The eightieth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The eighty-first packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The eighty-second packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The eighty-third packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The eighty-fourth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The eighty-fifth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The eighty-sixth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The eighty-seventh packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The eighty-eighth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The eighty-ninth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The ninetieth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The ninety-first packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The ninety-second packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The ninety-third packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The ninety-fourth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The ninety-fifth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The ninety-sixth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The ninety-seventh packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The ninety-eighth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127. The ninety-ninth packet is an ICMP Echo (ping) from 192.168.2.127 to 192.168.2.216. The hundredth packet is an ICMP Echo (ping) from 192.168.2.216 to 192.168.2.127.

Figure 11

**Right Host**  
**ip : 192.168.2.127**  
**hostname : right.taha.fedora**  
**operating system : fedora 24**

**Step 1 :** We installed fedora 24 on virtualbox and learned internet ip address via **ifconfig** command as seen as figure 2. After that, ping to left host because we try the connection before beginning and we observed not succesfull this ping. Problem and solution is same with left host so using Bridged Mode instead of NAT for the VM in the host VirtualBox GUI as seen as figure 1.

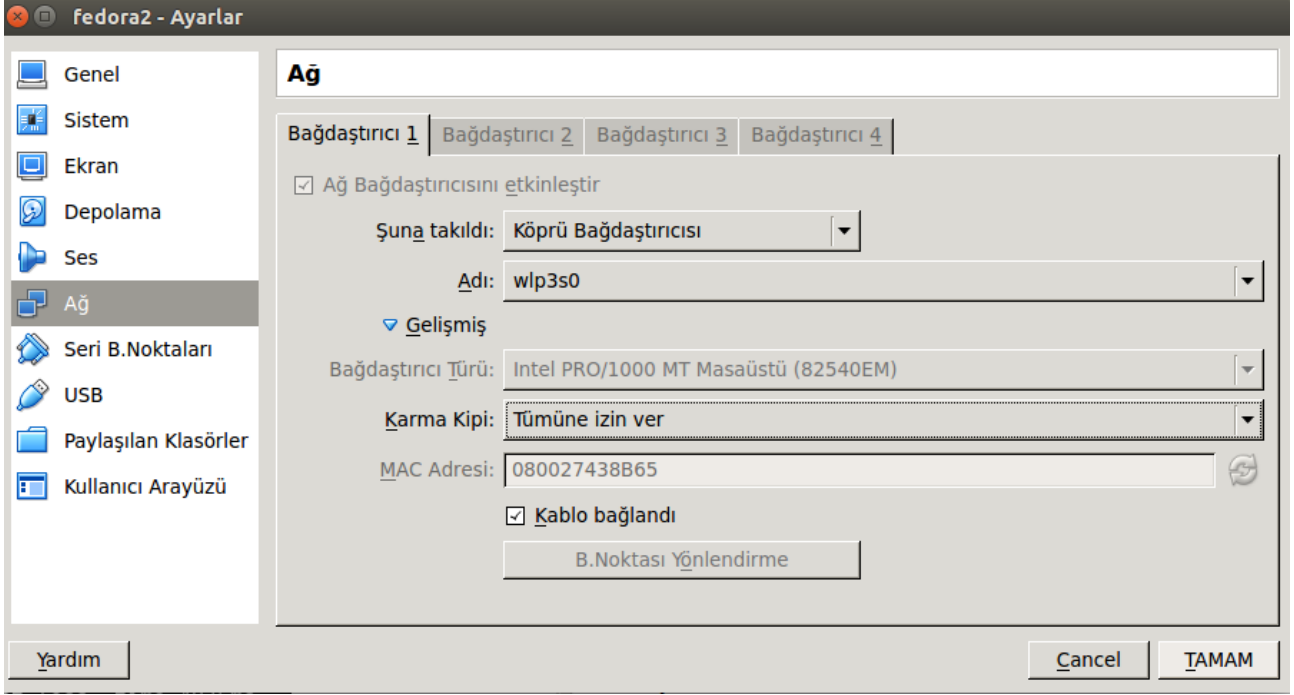

Figure 1

Figure 2

**Step 2 :** After learning the IP address of the left host, the "192.168.2.216 left.hasan.fedora" line was added to the "/etc/hosts" file and the pinged to left host for connection test and the protocol used for ping was observed as icmp on wireshark as seen as figure 3 and figure 4.

```

[taha@taha ~]$ ping left.hasan.fedora
PING left.hasan.fedora (192.168.2.216) 56(84) bytes of data.

Figure 4

### Step 3 : sudo dnf insall libreswan

# Installed libreswan program as seen as figure 5.

```

[taha@taha ~]$ sudo dnf install libreswan
Last metadata expiration check: 1:24:32 ago on Sat Dec 31 14:25:19 2
016.

```

Figure 5

#### Step 4 : **ipsec newhostkey --output /etc/ipsec.secrets**

# This command generated RSA key for host to using securely network traffic as seen as figure 6.

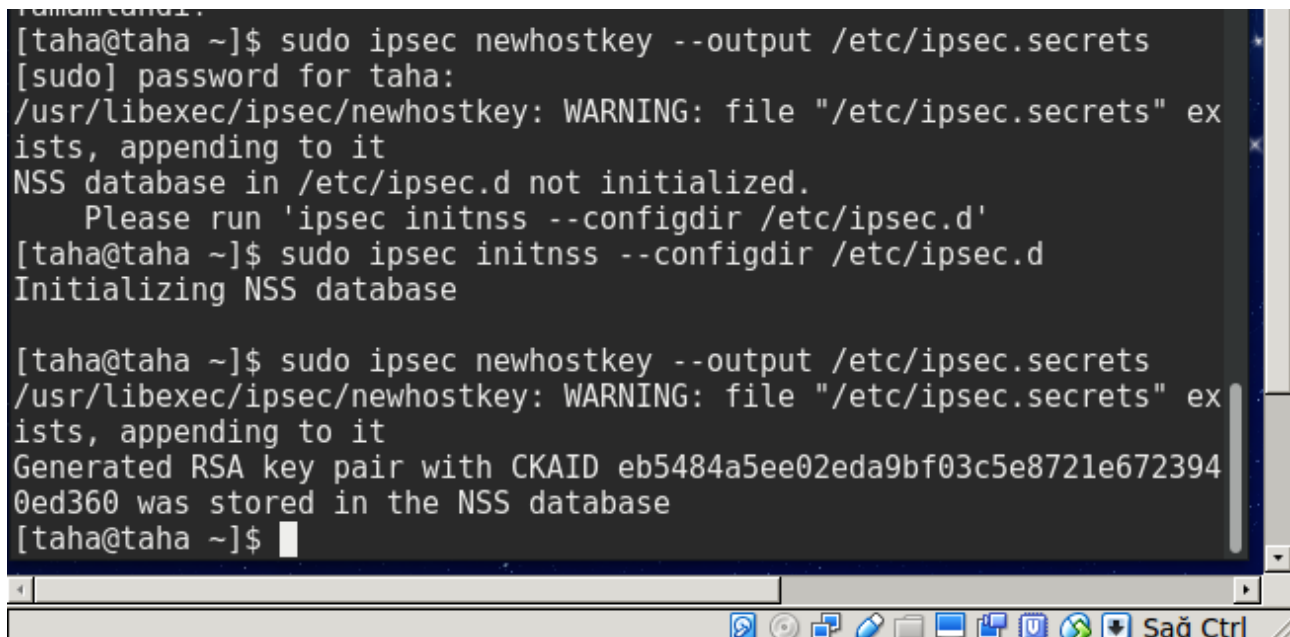

# "--output /etc/ipsec.secrets" is used to determined name and path.

# When we executed first time this command, we got an error for about initializing NSS database as left host.

#### **sudo ipsec initnss --configdir /etc/ipsec.d**

# We must run this command once time so initializing nss database. NSS is a userspace library utilized by the libreswan IKE daemon 'pluto' for cryptographic operations.

# After that, we executed "**ipsec newhostkey --output /etc/ipsec.secrets**" command and generated RSA key pair with CKAID as seen as figure 6.

```
[taha@taha ~]$ sudo ipsec newhostkey --output /etc/ipsec.secrets
[sudo] password for taha:
/usr/libexec/ipsec/newhostkey: WARNING: file "/etc/ipsec.secrets" exists, appending to it
NSS database in /etc/ipsec.d not initialized.
Please run 'ipsec initnss --configdir /etc/ipsec.d'
[taha@taha ~]$ sudo ipsec initnss --configdir /etc/ipsec.d
Initializing NSS database

[taha@taha ~]$ sudo ipsec newhostkey --output /etc/ipsec.secrets
/usr/libexec/ipsec/newhostkey: WARNING: file "/etc/ipsec.secrets" exists, appending to it
Generated RSA key pair with CKAID eb5484a5ee02eda9bf03c5e8721e6723940ed360 was stored in the NSS database
[taha@taha ~]$
```

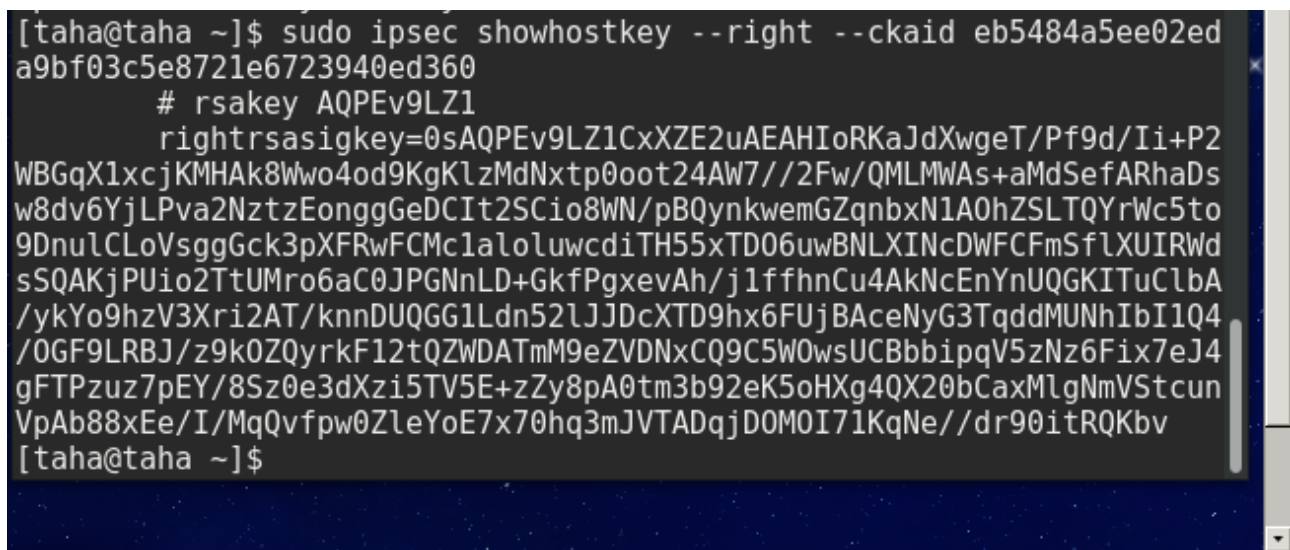

Figure 6

#### Step 5 : **ipsec showhostkey --right --ckaid eb5484a5ee02eda9bf03c5e8721e6723940ed360**

# We saw rsa key with this command as seen as figure 7.

# ckaid parameter is determined in the step 4.

# We run this command because the rightsrasigkey value is used to configuration of ipsec.conf file.

```
[taha@taha ~]$ sudo ipsec showhostkey --right --ckaid eb5484a5ee02eda9bf03c5e8721e6723940ed360

```

Figure 7

**Step 6 :** ipsec.conf file is configured as step 6 in left hosts part and copy under /etc folder. We explain again ipsec.conf file because we done in left host part and its same.

**Step 7 :** `systemctl start ipsec.service` # start ipsec service as seen as figure 8  
`sudo ipsec auto --add hasanTahaTunnel` # add new tunnel that name is hasanTahaTunnel  
`sudo ipsec sudo --up hasanTahaTunnel` # hasanTahaTunnel is activated as seen figure 8

# We observed "IPSec SA established tunnel mode {ESP=....}" the last line as seen as figure 8.

```
[taha@taha ~]$ sudo ipsec setup start
Redirecting to: systemctl start ipsec.service
[taha@taha ~]$ systemctl start ipsec.service
[taha@taha ~]$ sudo ipsec setup start
systemd: ipsec service is already running
[taha@taha ~]$ sudo ipsec auto --add hasanTahaTunnel
002 "hasanTahaTunnel": deleting connection
002 "hasanTahaTunnel" #4: deleting state (STATE_QUICK_R2)
005 "hasanTahaTunnel" #4: ESP traffic information: in=0B out=0B
002 "hasanTahaTunnel" #2: deleting state (STATE_QUICK_I2)
005 "hasanTahaTunnel" #2: ESP traffic information: in=0B out=0B
002 "hasanTahaTunnel" #3: deleting state (STATE_MAIN_R3)
002 "hasanTahaTunnel" #1: deleting state (STATE_MAIN_I4)
002 added connection description "hasanTahaTunnel"
[taha@taha ~]$ sudo ipsec auto --up hasanTahaTunnel
002 "hasanTahaTunnel" #5: initiating Main Mode

```

Figure 8

**Step 8 :** `ping 192.168.2.216` # ping to left host using ip address as seen as figure 9.  
`ping left.hasan.fedora` # ping to left host using hostname as seen as figure 10.

# We tested security network traffic by ping to left host from right host and we observed that provide connection with ESP as seen as figure 11.
